The PAF-AH product is useful for treating or preventing diabetes, for slowing the progression of diabetes mellitus, or reducing the incidence of diabetes mellitus. Note: The sequence listing included with this patent seems to be from a totally different patent. Only 2 human sequences were mentioned in the text, not the 38 (2 yeast plus 36 synthetic) sequences shown. The present sequence is one of the 36 sequences included in the sequence listing.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     nucleic acid (sinA) that downregulates expression of the breakpoint cluster region-v-abl Abelson murine leukaemia viral oncogene homologue 1 (BCR-ABL) gene. The siRNA of the invention demonstrates cytostatic activity and may be useful for modulating expression of the BCR-ABL gene, as well as for treating leukaemia or lymphoma and in diagnosis, drug screening, target identification and validation, genetic engineering, gene function studies and gene mapping. The current sequence is that of the human ERG2 (v-ets erythroblastosis virus E26 oncogene like (avian)) siDNA-RNA hybrid of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC epigenetically silenced genes. Specifically, it refers to the detection CC of epigenetically silenced genes. Specifically, it refers to the detection CC are transcriptionally inactive due to aberrant methylation at normally inactive due to aberrant methylation at normally cCC unmethylated CpG islands. Accordingly, these genes provide diagnostic CC diagnose various proliferative disorders, particularly oseophageal cancer CC and head and neck cancer. The present invention describes a genomic CC screening method to identify silenced genes in a cell suspected of a CC predisposition to, or exhibiting, unregulated growth. Accordingly, CC oligonuclectides of the genes identified herein are useful for detecting CC carcinoma. Furthermore, treatment can occur via gene therapy, using a CC demethylation agent such as a methyltransferase inhibitor (SARa-CO) or a cmethylation silenced gene in cancer cells. This oligonuclectide sequence cis an RT-PCR primer used to amplify those genes that were up-regulated as a result of treatment with a demethylation agent i.e epigenetically creatment cancer cells.
                                                                                                                                                                                                                                                   RESULT 1804

upon methylation and in determining the efficacy and mechanisms of demethylation action in cancer cells. The present DNA sequence represents a PCR primer that was used in the exemplification of the invention.
                                                                                                                              The invention comprises a high throughput method for assessing genomic CpG methylation and expression of genomic sequences of a tissue sample. The method involves the use of a microarray that has affixed CpG-rich genomic probe fragments each comprising an exon sequence (or portion thereof) of an expressible gene. The method and microarray of the invention are useful for assessing genomic CpG methylation and expression of genomic sequences of a tissue sample. The method is useful for the identification of novel methylation silenced genes that are reactivated

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     S
                                                               origin. These proteins include GPCR185, GPCR186, GPCR187, GPCR188,

GPCR189, GPCR222 and GPCR223. Proteins of the invention are used in the

treatment and prevention of diseases associated with inflammation,

cangiogenesis and tissue neogenesis, including hepatitis, nephritis,

cdermatitis, pancreatitis, rheumatoid arthritis, osteoarthritis, atopic

dermatitis, asthma, diabetes, hypertipenda, Alzheimer's disease,

gastric ulcer, arteriosclerosis, hyperlipenda, Alzheimer's disease,

cdementia, obesity, pulmonary fibrosis, renal fibrosis, immune deficiency,

infertility, urinary blockage and cancer (such as cancer of the brain,

neck, tongue, lung, breast, pancreas, stomach, colon, duodenum, prostate,

bladder, ovary, womb or rectum). Primers of the invention are devised and

csynthesised based on G-protein coupled receptor consensus sequences and

used for 5'-ARCE (rapid amplification of cDNA ends) and 3'-RACE

amplification of human cDNA derived from adrenal and visual cortex RNA.

Sequences given in ADE34534-ADE34533 represent human G-protein coupled

receptor proteins, genes encoding them, and primers for the amplification

of these sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 15-MAR-2002;

                                                                                                                The invention relates to a method of diagnosing recurrent pregnancy (RPL). The method involves examining formin (Fmn)-2 gene for a muta and measuring biological activity and expression of Fmn-2, in which decreased levels indicates an increased risk for RPL; or examining person's formin-2 gene for polymorphisms, in which the presence of polymorphism indicates an altered risk for RPL. The method is used diagnosing and treating RPL e.g. in humans. The present sequence is primer used to amplify mouse Fmn-2 DNA
                                                                                                                                                                                                                                                 Diagnosing recurrent pregnancy loss comprises examining formin-2 gene for a mutation and measuring biological activity and expression of formin-2 identified to play a role in occyte development.

The invention relates to an isolated nucleic acid (NI) comprising at CC least 20 but not more than 1500 consecutive nucleotides of the optineurin CC promoter appearing as ADE13890. Also included are the optineurin promoter operably linked to a heterologous nucleic acid, a nucleic acid capable of detecting a single nucleotide polymorphism (SNP) in the optineurin CC promoter, a host cell comprising the promoter operably linked to a heterologous sequence, diagnosing or prognosing glaucoma in a sample CC heterologous sequence, diagnosing or prognosing glaucoma in a sample CC in a promoter region of the optineurin gene, associated with a glaucoma CC in a promoter region of the optineurin gene, associated with a glaucoma CC in a sample containing DNA, determining the presence or increased CC susceptibility to glaucoma or to a progressive ocular hypertensive CC disorder resulting in loss of visual field in a patient (or the severity CC or progression of glaucoma in a patient, comprising providing CC amplification reaction primers that direct amplification of a selected containing the presence or increased CC amplification reaction primers that direct amplification of a selected containing a sample containing the variation within the optineurin CC amplification primers that direct amplification of a selected containing a sample containing human genomic DNA, providing a nucleic acid capable of detecting a SNP located within an optineurin promoter, and CC capable of detecting a SNP located within an optineurin promoter, and containing the providing and also to treat glaucoma related disorders. The present sequence is an optineurin promoter motif, repeat element or contains or contains of the present sequence is an optineurin promoter motif, repeat element or contains or con
                                                                                                                                                  Query Match

The invention relates to a method of modulating cell necrosis comprising administering an agent that can modulate a BNIF3 gene or protein to a cell or animal. The method is useful inhibiting cell necrosis for treating a neurological disease (e.g. traumatic brain injury, ischaemic and haemorrhagic stroke, Alzheimer's disease, Huntington's disease, amyotropic lateral sclerosis (ALS), multiple sclerosis, AIDS, Parkinson's disease, Pick's disease, epilepsy, excitotoxicity, genetic disorders, inborn errors of metabolism, and neurogenesis) or a cardiovascular disease (e.g. cardiac hypoxia, cardiac hypoxia-reoxygenation, cardiac ischaemia-reperfusion injury, ischaemic heart disease, heart failure, heart hypertrophy, by-pass surgery, coronary angioplasty, vascular defects, congenital heart (defects) disease, cardiac cell muscle preventing or inhibiting neural cell death, cardiovascular cell death, or hypoxia-induced cerdideath. The present sequence represents a BNIP3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ss; human; cell necrosis; BNIP3; neurological disease; traumatic brain injury; ischaemic stroke; hamournhagic stroke; Alzheimer's disease; Huntington's disease; ALS; multiple sclerosis; AIDs Parkinson's disease; Pick's disease; epilepsy; genetic disorder; cardiovascular disease; cardiac hypoxia; cardiac hypoxia-reoxygenation; cardiac ischaemia-reperfusion injury; ischaemic heart disease; heart hypertrophy; by-pass surgery; coronary angioplasty.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Modulating cell necrosis, useful for treating cardiovascular (e.g. cardiac hypoxia or heart failure) or neurological diseases (e.g. Alzheimer's disease or multiple sclerosis), comprises administering

A pharmaceutical composition comprising the sirNA modulates SOST expression and modulates the ability of sclerostin to decrease osteoblastic activity. It is used for increasing bone density in a mammal and for decreasing apoptosis of bone cells (claimed). It can also be used to modulate bone resorption and augment bone mineralization, to prevent or treat apoptosis of bone related cells or loss of bone density, and to treat osteoporosis, osteomyelitis, hypercalcaemia, osteopenia brought on by surgery or steroid administration, Paget's disease, osteonecrosis, bone loss due to the property of the property of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             01-MAR-2002;

This gene encodes sclerostin, a bone morphogenetic protein antagonist and regulator of bone matrix formation. The SOST target region (see ACF79822) for the SIRNA was selected for its high content of AA dinucleotides and minimal

                                                                                                                                                                                 The invention relates to an isolated nucleic acid (N1) comprising at CC least 20 but not more than 1500 consecutive nucleotides of the optineurin CC promoter appearing as ADE13890. Also included are the optineurin promoter operably linked to a heterologous nucleic acid, a nucleic acid capable of CC detecting a single nucleotide polymorphism (SNP) in the optineurin CC promoter, a host cell comprising the promoter operably linked to a ccl comprising detecting a polymorphism ccl in a promoter region of the optineurin gene, associated with a glaucoma cc phenotype), detecting a SNP sequence variation in a sample containing CC DNA, detecting the presence of an optineurin promoter sequence variation cc in a sample containing DNA, determining the presence or increased consceptibility to glaucoma or to a progressive ocular hypertensive ccl susceptibility to glaucoma in a patient, comprising providing compression of glaucoma, in a patient, comprising providing capable of detecting a palymorphism (comprising providing an patient (or the severity compression reaction primers that direct amplification of a selected containing a sample containing the variation within the optineurin comprising containing a sample containing the variation within the optineurin comprising containing a sample containing human genomic DNA, providing a nucleic acid capable of detecting a SNP located within an optineurin promoter, and compresent sequence is an optineurin promoter motif, repeat element or contained to treat glaucoma related disorders. The present sequence is an optineurin promoter motif, repeat element or contained to treat glaucoma related disorders.

                                                                                                                                                                                                          The invention relates to a novel compound targeted to a nucleic acid molecule encoding a B-cell associated protein (BAP), where the compound specifically hybridises with the nucleic acid and inhibits expression of the protein. The compound of the invention demonstrates cytostatic, antiinflammatory and antimicrobial activities and may be useful for inhibiting the expression of BAP in cells or tissues thus, via antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 21
                                                                                                                                     therapy, preventing a hyperproliferative disorder such as cancer, particularly breast or prostate cancer, as well as a disorder characterised by altered levels of apoptosis, infection or inflammation. The current sequence is that of the PCR primer 1 of the invention which was used to amplify human B-cell associated protein DNA.
                                                                                                                                                                                                                                                                                                                                                        New antisense compound that hybridizes and inhibits a nucleic acid encoding a B-cell associated protein, useful for treating animal hadisease or condition associated with B-cell associated protein, e.c.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              B-cell associated protein; BAP; cytostatic; antiinflammatory; antimicrobial; antisense therapy; hyperproliferative; breast; prostate cancer; apoptosis; infection; inflammation; human; PCR; primer;

                                                                                              The present sequence is that of a portion (GC content 47.6%) of the human CC CSOST gene. RNA derived from this DNA sequence is a target for a small content ferring RNA (siRNA) of the invention (see ACF79810) designed to inhibit expression of the SOST gene. The sequence was selected as a C target from its high content of AA dinucleotides and minimal homology to other known coding sequences. The SOST gene encodes sclerostin, a bone morphogenetic protein antagonist and regulator of bone matrix formation. CA pharmaceutical composition comprising the siRNA modulates SOST CC expression and modulates the ability of sclerostin to decrease conteoblastic activity. It is used for increasing bone density in a mammal and for decreasing apoptosis of bone cells (claimed). It can also be used to modulate bone resorption and augment bone mineralization, to prevent creat apoptosis of bone-related cells or loss of bone density and to treat osteoporosis, osteomyelitis, hypercalcaemia, osteopenia brought on by surgery or steroid administration, Paget's disease, osteonecrosis, bone loss due to rheumatoid arthritis, periodontal bone loss, prosthetic concerning and osteolytic metastasis

         The invention relates to a novel isolated double stranded RNA oligonucleotide about 19 to about 25 ribonucleotides in length or its equivalent. One strand of the oligonucleotide comprises the same nucleotide sequence as a region of a hepatitis C virus (HCV) target RNA polynucleotide sequence required for hepatitis C virus infection, replication or pathogenesis in vitro or in vivo in a host cell. The oligonucleotide of the invention demonstrates virucide activity and may be useful for preparing a composition or vaccine for treating or preventing hepatitis C virus, as well as during gene therapy procedures. The current sequence is that of the anti-HCV agent LZ-PAIR DNA-RNA hybri
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             oligonucleotide about 19 to about 25 ribonucleotides in length or its equivalent. The invention relates to an isolated or purified nucleic acid from a virus associated with multiple sclerosis and/or rheumatoid arthritis, multiple sclerosis and/or rheumatoid arthritis, multiple sclerosis of comprise pol, gag or reverse transcriptase genes (or their fragments) encoding the proteins or defined peptides (including immunodominant peptides, antigenic peptides or conserved motifs). Also included are a process for detecting a virus associated with multiple sclerosis or rheumatoid arthritis in a biological sample, a nucleic acid probe for the detection of a virus associated with multiple sclerosis or rheumatoid arthritis, an office of virus associated with multiple sclerosis or rheumatoid arthritis, and primer for the amplification by polymerisation of a nucleic acid of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                and the determination of their relative frequencies constitutes the functional allele profile of the gene of interest in the population. method is useful for determining functional allele profiles which are useful in the treatment and diagnosis of diseases, for genetic and pharmacogenetic applications, and for evaluating the degree to which gene(s) are under selective pressure. The present sequence represents sequencing primer used in the method of the invention.
                                                                                                                                                                                           New isolated or purified nucleic acid associated with multiple sclerosis and/or rheumatoid arthritis, useful for detecting a virus associated with multiple sclerosis or rheumatoid arthritis in a biological sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Multiple sclerosis associated retrovirus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 21

SUMITOMO SEIYAKU KK

The invention relates to a novel method for detecting differentiation of an osteoclast from the macrophage like cell derived from a monocyte. The method involves making a parameter expression fluctuation of a P2 X4 receptor, a P2 X5 receptor and/or P2 X6 receptor. The method of the invention has osteopathic, antirheumatic, antiarthritic, dermatological, immunosuppressive, antiinflammatory, and cytostatic activity. A preventative agent of the invention which is an inhibitor is useful in the treatment of disease including the abnormality of bone metabolism n of The

```
The invention relates to an isolated polypeptide comprising one of 127 CC sequences (appearing as ABO1288-ABO1414) designated as NOVX, a mature CC form of NOVX, an amino acid sequence which is at least 95% identical to CC NOVX or an amino acid sequence comprising one or more conservative cc substitutions in NOVX. Also included are nucleic acids encoding NOVX CC proteins, determining the presence or amount of NOVX or NOVX DNA in a CC sample (by introducing the sample to an antibody that binds co immunospecifically to the polypeptide, and determining the presence or amount of antibody bound to the polypeptide, determining the presence of cc amount of antibody bound to the polypeptide, and termining the presence of cc arredisposition to a disease associated with altered levels of CC expression of NOVX or NOVX DNA in a first mammalian subject, identifying can agent that binds to NOVX, identifying a potential therapeutic agent cf or treatment of a pathology related to aberrant expression or aberrant CC physiological interactions of NOVX, screening for a modulator of activity of or of latency or predisposition to a pathology associated with NOVX, a creening for a modulator of activity of or of latency or predisposition to a pathology associated with NOVX, a creening pathologies, diseases, conditions or disorders associated with the colories and in diagnosing and colories associated with NOVX or NOVX antibody. The NOVX mucleic acids and polypeptides are useful as a marker for cell or tissue type, and in diagnosing and the colories associated with the nova mucleic acids and polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      20-SEP-2001;

```

ç

The present invention relates to a method for determining a functional allele profile of a gene in a population. The method comprises identifying the nucleotide sequence of a gene of interest out of genomic DNA from each of a population of individuals identified as having a family history which indicates inheritance of functional alleles of the gene of interest, and rank ordering the frequency of occurrence of each haplotype, where the identity of the alleles containing each haplotype

of genomic

These may also be used to screen for molecules which inhibit or enhance NOVX activity or function, and for detecting specific cell types. These may also be used in chromosome mapping, gene therapy, tissue typing, and in forcensic biology. The present sequence is a reverse transcriptase (RT)-PCR probe used to assess the tissue specific expression of mRNA encoding a NOVX protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                             Functional allele profile; genetic inheritance; haplotype; population; disease; pharmacogenetic application; selective pressure; human; MSH2; MLH1; BRCA1; BRCA2; FTEN; BAP1; BARD1; p53; sequencing; primer; ss.

cc immunospecifically to the polypeptide, and determining the presence or cc amount of antibody bound to the polypeptide), determining the presence of cor predisposition to a disease associated with altered levels of expression of NOVX or NOVX DNA in a first mammalian subject, identifying can agent that binds to NOVX, identifying a potential therapeutic agent cfor treatment of a pathology related to aberrant expression or aberrant comprising the vector comprising or predisposition to a pathology associated with NOVX, a core of latency or predisposition to a pathology associated with NOVX, a core of or of latency or predisposition to a pathology associated with NOVX, a core of or of latency or predisposition to a pathology associated with NOVX, and an anati-NOVX antibody. The NOVX nucleic acids and polypeptides covering pathologies, diseases, conditions or disorders associated with COVX sequences, including cardiomypathy, atherosciarcosis, hypertension, congenital heart defects, prostate cancer, diabetes, metabolic disorders, congenital heart defects, prostate cancer, diabetes, metabolic disorders, consecutated cachexia, neurodegenerative disorders (e.g. Alzheimer's associated cachexia, neurodegenerative disorders, haematopoietic consecutated with chronic disorders, haematopoietic disorders descripted with chronic disorders. disorders, dyslipidaemias, and wasting disorders associated with chronic diseases. These may also be used to screen for molecules which inhibit or enhance NOVX activity or function, and for detecting specific cell types. NOVX or an amino acid sequence comprising one or more conservative substitutions in NOVX. Also included are mucleic acids encoding NOVX proteins, determining the presence or amount of NOVX or NOVX DNA in sample (by introducing the sample to an antibody that binds These may also be used in chromosome mapping, gene therapy, tissue typing, and in forensic biology. The present sequence is a reverse transcriptase (RT)-PCR probe used to assess the tissue specific expression of mRNA encoding a NOVX protein form of NOVX, tion relates to an isolated polypeptide comprising one of 127 (appearing as ABO1288-ABO1414) designated as NOVX, a mature OVX, an amino acid sequence which is at least 95% identical to a

New polypeptides and polynucleotides having properties related to stimulation of biochemical or physiological responses in a cell c tissue, useful for diagnosing or preventing e.g. atherosclerosis, hypertension, prostate cancer.

Example 849pp; English.

The invention relates to an isolated polypeptide comprising one of 127 CC sequences (appearing as AB01288-AB01414) designated as NOVX, a mature CC form of NOVX, an amino acid sequence which is at least 95% identical to CC NOVX or an amino acid sequence comprising one or more conservative groteins, determining the presence or amount of NOVX DNA in a CC sample (by introducing the sample to an antibody that binds corrected from the polypeptide, and determining the presence or amount of antibody bound to the polypeptide, and determining the presence of cor predisposition to a disease associated with altered levels of cor predisposition to a disease associated with altered levels of cor predisposition to a disease associated with altered levels of cor predisposition to a pathology related to aberrant expression or aberrant cc physiological interactions of NOVX, screening for a modulator of activity of or of latency or predisposition to a pathology associated with NOVX, a ccl comprising NOVX DNA, a cell comprising the vector (used to produce NOVX) and an anti-NOVX antibody. The NOVX mucleic acids and polypeptides are useful as a marker for cell or tissue type, and in diagnosing and creating pathologies, diseases, conditions or disorders associated with NOVX, a congenital heart defects, prostate cancer, diabetes, metabolic disorders, congenital asthma, Crohn's cc associated cachexia, neurodegenerative disorders (e.g. Alzheimer's disease, validations or parkinson's disease, immune disorders, haematopoietic consisted with chronic disease or parkinson's disease, immune disorders, haematopoietic consisted with other parkinson's disease, immune disorders, haematopoietic consisted with chronic diseases and wasting disorders, haematopoietic disorders, dyslipidaemias, and wasting disorders associated with chronic diseases. These may also be used to screen for molecules which inhibit or enhance NOVX activity or function, and for detecting specific cell types. These may also be used in chromosome mapping, gene therapy, tissue typing, and in forensic biology. The present sequence is a reverse transcriptase expression of and in forensic biology. The present sequence is a reventuate (RT)-PCR probe used to assess the tissue specific

```
The invention relates to an isolated polypeptide comprising one of 127 CC sequences (appearing as AB01288-AB01414) designated as NOVX, a mature CC form of NOVX, an amino acid sequence which is at least 95% identical to CC NOVX or an amino acid sequence comprising one or more conservative cC substitutions in NOVX. Also included are nucleic acids encoding NOVX CC proteins, determining the presence or amount of NOVX or NOVX DNA in a CC sample (by introducing the sample to an antibody that binds or amount of NOVX or NOVX DNA in a first mammalian subject, identifying corrections of NOVX or NOVX DNA in a first mammalian subject, identifying an agent that binds to NOVX, identifying a potential therapeutic agent CC an agent that binds to NOVX, identifying a potential therapeutic agent CC private of attency or predisposition to a pathology related to aberrant expression or aberrant cC physiological interactions of NOVX, screening for a modulator of activity of or of latency or predisposition to a pathology associated with NOVX, a vector comprising NOVX DNA, a cell comprising the vector (used to produce CC NOVX) and an anti-NOVX antibody. The NOVX nucleic acids and polypeptides are useful as a marker for cell or tissue type, and in diagnosing and CC treating pathologies, diseases, conditions or disorders associated with NOVX, a congenital heart defects, prostate cancer, diabetes, metabolic disorders, disease, Nulliple sclerosis, infectious diseases, anceraia, cancer-cancer, diseases, disease, disease, and wasting disorders, haematopoietic conspanies, prostate cancer, disperse which inhibit or enhance of the constant of the constan

RESULT 1786 ACD06741/c

The invention relates to an isolated polypeptide comprising one sequences (appearing as ABO1288-ABO1414) designated as NOVX, a m form of NOVX, an amino acid sequence which is at least 95% ident

identical to mature

of 127

New polypeptides and polynucleotides having stimulation of biochemical or physiological tissue, useful for diagnosing or preventing

properties related to responses in a cell or e.g. atherosclerosis,

prostate cancer. 722; 849pp;

CC The invention relates to an isolated polypeptide comprising one of 127 CC sequences (appearing as ABO1288-ABO1414) designated as NOVX, a mature form of NOVX, an amino acid sequence which is at least 95% identical to CC NOVX or an amino acid sequence which is at least 95% identical to CC Substitutions in NOVX. Also included are nuclei acids encoding NOVX CC proteins, determining the presence or amount of NOVX or NOVX DNA in a CC sample (by introducing the sample to an antibody that binds CC immunospecifically to the polypeptide, and determining the presence or amount of antibody bound to the polypeptide, and determining the presence of CC amount of antibody bound to the polypeptide, and determining the presence of CC or predisposition to a disease associated with altered levels of CC expression of NOVX or NOVX DNA in a first mammalian subject, identifying an agent that binds to NOVX, identifying a potential therapeutic agent CC for treatment of a pathology related to aberrant expression or aberrant CC physiological interactions of NOVX, screening for a modulator of activity of or of latency or predisposition to a pathology associated with NOVX, a vector comprising NOVX DNA, a cell comprising the vector (used to produce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  20-SEP-2001

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC NOVX) and an anti-NoVX antibody. The NOVX nucleic acids and polypeptides are useful as a marker for cell or tissue type, and in diagnosing and CC treating pathologies, diseases, conditions or disorders associated with CC NOVX sequences, including cardiomyopathy, atherosclerosis, hypertension, CC congenital heart defects, prostate cancer, diabetes, metabolic disorders, CC neoplasm, graft versus host disease, AllS, bronchial asthma, Crohn's CC disease, multiple sclerosis, infectious diseases, acancer-CC associated cachexia, neurodegenerative disorders (e.g. Alzheimer's CC disease or Parkinson's disease), immune disorders, haematopoietic CC disease or Parkinson's disease, immune disorders, haematopoietic CC diseases. These may also be used to screen for molecules which inhibit or CC enhance NOVX activity or function, and for detecting specific cell types. CC transcriptase (RT)-PCR probe used to assess the tissue specific certains of mRNA encoding a NOVX protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

```
The invention relates to an isolated polypeptide comprising one of 127 cc sequences (appearing as ABO1288-ABO1414) designated as NOVX, a mature cf form of NOVX, an amino acid sequence which is at least 95% identical to the form of NOVX and amino acid sequence which is at least 95% identical to composite the presence or amount of NOVX DNA in a substitutions in NOVX. Also included are nucleic acids encoding NOVX cc proteins, determining the presence or amount of NOVX DNA in a cc sample (by introducing the sample to an antibody that binds core camount of antibody bound to the polypeptide, and determining the presence or cc amount of NOVX or NOVX DNA in a first mammalian subject, identifying an agent that binds to NOVX, identifying a potential subject, identifying can agent that binds to NOVX, identifying a potential therapeutic agent for treatment of a pathology related to aberrant expression or aberrant cc physiological interactions of NOVX, screening for a modulator of activity co for of latency or predisposition to a pathology associated with NOVX, a creening for a modulator of activity co for of latency or predisposition to a pathology associated with NOVX, and an anti-NOVX antibody. The NOVX nucleic acids and polypeptides care useful as a marker for cell or tissue type, and in diagnosing and complaint pathologies, diseases, conditions or disorders associated with NOVX sequences, including cardiomyopathy, atherosclerosis, hypertension, compenital heart defects, prostate cancer, diabetes, metabolic disorders, cell sease, AIDS, bronchial asthma, Crohn's cellsease or parkinson's disease, AIDS, bronchial asthma, Crohn's cellsease, multiple sclerosis, infectious diseases, anorexia, cancer-cellsease, and seases. These may also be used to screen for molecules which chronic cellsease which inhibit or enhance NOVX activity or function, and for detecting specific cell types.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ફ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated polypeptide comprising one of 127 CC sequences (appearing as ABOL288-ABOL414) designated as NOVX, a mature CC form of NOVX, an amino acid sequence which is at least 95% identical to CC NOVX or an amino acid sequence comprising one or more conservative CC substitutions in NOVX. Also included are nucleic acids encoding NOVX CC proteins, determining the presence or amount of NOVX or NOVX DNA in a CC sample (by introducing the sample to an antibody that binds CC immunospecifically to the polypeptide, and determining the presence or amount of entibody bound to the polypeptide, determining the presence of CC expression of NOVX or NOVX DNA in a first mammalian subject, identifying can agent that binds to NOVX, identifying a potential therapeutic agent for treatment of a pathology related to aberrant expression or aberrant cyphysiological interactions of NOVX, screening for a modulator of activity of or of latency or predisposition to a pathology associated with NOVX, a creeting pathologies, diseases, conditions or disorders associated with NOVX and an anti-NOVX antibody. The NOVX nucleic acids and polypeptides are useful as a marker for cell or tissue type, and in diagnosing and congenital heart defects, prostate cancer, diabetes, metabolic disorders, congenital heart defects, prostate cancer, diabetes, metabolic disorders, associated cachexia, neurodegenerative disorders (e.g. Alzheimer's condisease or Parkinson's disease, infectious diseases, hardwarders and wasting disorders, haematopoietic condisease or parkinson's disease, infectious diseases, hardwarders and with chronic disorders, haematopoietic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

nypertension, prostate cancer. New polypeptides and polynucleotides having properties related to stimulation of biochemical or physiological responses in a cell or tissue, useful for diagnosing or preventing e.g. atherosclerosis,

Example C; Page 735; 849pp; English.

The invention relates to an isolated polypeptide comprising one of 127 cc form of NOVX, an amino acid sequence which is at least 95% identical to CC form of NOVX, an amino acid sequence comprising one or more conservative comprising to a mature cc substitutions in NOVX. Also included are nucleic acids encoding NOVX CC proteins, determining the presence or amount of NOVX DNA in a CC sample (by introducing the sample to an antibody that binds correction to a disease associated with altered levels of cc amount of antibody bound to the polypeptide, and determining the presence or amount of antibody bound to the polypeptide, and determining the presence of cc amount of antibody bound to the polypeptide, and determining the presence of cc amount of antibody bound to the polypeptide, and determining the presence of cc are disposition to a disease associated with altered levels of cc an agent that binds to NOVX DNA in a first mammalian subject, identifying conformations of NOVX prelated to aberrant expression or aberrant compression or aberrant comprising NOVX DNA, a cell comprising for a modulator of activity of or of latency or predisposition to a pathology associated with NOVX, a creening for a modulator of activity of or of latency or predisposition to a pathology associated with NOVX, a creening pathologies, diseases, conditions or disorders associated with Cc congenital heart defects, prostate cancer, diabetes, metabolic disorders, congenital heart defects, prostate cancer, diabetes, metabolic disorders, congenital heart defects, prostate cancer, diabetes, metabolic disorders, congenital exclavation, and an antivolation of activity of diseases. These may also be used to screen for molecules which inhibit or chance may also be used to screen for molecules which inhibit or chance may also be used to screen for molecules which inhibit or constant and contexts. chromosome mapping,

                                                                                                                                                                                                                                The invention relates to an isolated promoter that is capable of driving transcription in a vascular tissue-preferred manner, and that is natively associated with the DNA coding for Prunus serotina prunasin hydrolase. The vascular tissue preferred promoters are useful in regulating gene expression in plants to exhibit specific phenotypic traits, such as increased resistance to abiotic stress (e.g. drought, temperature, salinity, ozone, and toxins such as pesticides and herbicides), or to biotic stress such as attacks by pathogens including insects, viruses, bacteria, fungi or nematodes. The present sequence represents a PCR primer specific for the P. serotina prunasin hydrolase variation promoter
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New nucleic acid molecule for regulating gene expression in plexhibit specific phenotypic traits, e.g. increased resistance temperature, toxins or attacks by pathogens including insects,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     P. serotina

The NOVX polypeptides, nucleic acids encoding the polypeptides, and CC NOVX-associated disorder in humans and for treating a syndrome associated CC with a human disease (NOVX-associated disorder). NOVX polypeptides and CC With a human disease (NOVX-associated disorder). NOVX polypeptides and CC with a human disease (NOVX-associated disorder). NOVX polypeptides and CC predisposition to a disease associated with altered levels of NOVX CC polypeptide and polynucleotide, by measuring the level of polypeptide (CC expression or the amount of nucleic acid from a mammal and comparing it conjugated to the amount of nucleic acid from a mammal and comparing it conjugated to a slso useful for identifying an agent that that conjugated the pression or activity of NOVX. The antibodies and a cell expression or activity of NOVX. The antibodies and a cell expression or activity of NOVX. The antibodies are also useful for treating a pathological state in a mammal. The antibodies are also useful for treating or preventing disorders or syndromes conjugated the NOVX polypeptides are useful for treating or preventing disorders or syndromes conjugated the NOVX proteins, to detect NOVX mRNA, or a genetic lesion in CC and pressing the NOVX activity. NOVX sequences are also useful for identifying an apont that for a serior or syndromes conjugated the novy proteins, to detect NOVX mRNA, or a genetic lesion in CC and see in identifying and/or cloning NOVX sequences are also useful for seeing the NOVX proteins, to detect NOVX mRNA, or a genetic lesion in CC anison or body fluids in forensic biology and as primers and probes constitution of security and protein as tissues e.g. Alzhatner's constitution of the conjugated conjugated to the conjugated conjugated and protein levels confusion to the conjugated conjugated to the conjugated conjugated conjugated conjugated conjugated conjugated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

New chimeric DNA encoding a membrane bound protein, useful for treating conditions associated with cells infected with virus or tumor cells, e.diseases caused by HIV (AIDS), cytomegalovirus, hepatitis C or B, or e.g.

Example 3; Fig 10; 53pp; English.

The invention relates to chimaeric DNA encoding a membrane bound protein comprising, in reading frame, DNA encoding: (a) a signal sequence; (b) a CC non-MHC restricted extracellular binding domain of a surface membrane CC protein that binds specifically to at least one ligand, which is a CC protein; (c) a transmembrane domain; and (d) a cytoplasmic signal-CC transducing domain of a protein that activates an intracellular messenger CC system. The extracellular and cytoplasmic domain are not naturally joined to an CC extracellular ligand-binding domain. The chimaeric DNA intitates CC signalling in the host cell when the chimaeric DNA intitates suitable for expression. Also included are: 1) an expression cassette comprising a cranscriptional control of the transcriptional initiation region, the chimaeric DNA under the CC transcriptional control of the transcriptional initiation region; (2) a retroviral RNA or DNA construct comprising the expression cassette; (3) a cell comprising the C-terminal direction comprising in the N- to C-terminal direction the chimaeric protein comprising in the N- to C-terminal direction the chimaeric protein comprising in the N- to C-terminal direction the chimaeric protein as a surface membrane protein; (6) activating cells by means of a secondary messenger pathway; (7) producing a source of cytocoxic effector cells for killing cells infected with virus or cells comprising the sequence and transplanting cells to form modified cell into a mammal; and (8) treating disease associated with cells cinfected with virus or tumour cells such as diseases caused by HIV (e.g. Human immunodeficiency virus causing AIDS, acquired immunodeficiency The Syndrome), cytomegalovirus, hepatitis C or B, or Mycobacterium avium. Decristofaro MF, Padigaru M, Miller C, Tchernev V, Zhong M, Anderson D, Ballinger R, Gerlach V, Spyt-Burgess CE, Vernet CAM, Kekuda R, Guo X, Zerhuse E, Eisen A, Wol M, Taupier RJ, E, Smithson G, D, Ballinger R, Gerlach V, Spytek KA, Ras Zerhusen B, Andrew D, Wezes P, Patturajan A, Wolenc A, Baumgartner J, Shimkets RA, er RJ, Pena C, Shenoy S, Li L, Casman S, hson G, Malyankar U, Taillon B, Liu X; Zhong H; k KA, Rastelli L; Gusev V; Boldog F;

New polypeptides, designated as NOVX, useful for diagnosing and treating infections, neurological diseases, cancer, allergy, and bone, immunological, skin, renal, brain, muscle and autoimmune disorders.

Example 1; Page 499; 672pp; English.

CR (NOVI - 33), consisting of a mature form of one of 61 sequences, given in CR the specification, or its variant, where amino acid residue(s) in the correct than 1s to fee the amino acids from the variant differ from the mature form, provided that the variant differs in CR ont more than 1s to fee the amino acids from the sequence of the mature of CR of the matched disorder in humans and for treating a syndrome associated CR with a human disease (NoVX-associated disorder). NOVX polypeptides, are useful for determining the presence of or CR predisposition to a disease associated disorder). NOVX polypeptide and CR with another mammal not having or not predisposed to the disease. NOVX CR polypeptide is also useful for identifying an agent that modulates the expression or the amount of nucleic acid from a mammal and comparing it conjupeptide having 55 % sequence identify to NOVX. The antibodies and a cell expression or activity of NOVX. The antibodies and a cell expression or activity of NOVX. The antibodies are useful for identifying an agent that binds to NOVX CR polypeptide having 55 % sequence identify to NOVX polypeptide are useful for clentifying an agent that binds to NOVX CR polypeptides, polypucleotides and antibodies specific for the expression or the expression or activity of NOVX. The antibodies are useful for identifying an agent that binds to NOVX CR polypeptides, polypucleotides and antibodies specific for the polypeptides are useful for treating or preventing disorders or syndromes conjupeptides, polypucleotides and antibodies specific for the polypeptides are useful for treating or preventing disorders or syndromes conjupeptides, polypucleotides and antibodies specific for the NOVX perceins. The NOVX perceins are useful for the NOVX motorial samples such as e.g., Alzheimer's clistent of the NovX proteins are useful for antibody and as primers and probes conjugated to protein activity. The NoVX protein antifying and/or activity of NOVX protein and for identifying candors revaluating modulators of NO

                                                                                                                                                                                                                                                                          The present invention relates to novel double stranded (ds) DNA sequences which can interact with a third strand to form a stable triple helix. The invention also relates to a method for purifying a ds DNA molecule, comprising contact with a third DNA strand that interacts with a target sequence (TS) in the ds DNA to form a triple helix. To illustrate the invention, an oligonucleotide from human FGF1 gene (ABQ81003) was used as the ds DNA sequence. The present sequence is an oligonucleotide used in affinty chromatography of ABQ81003

The nucleic acid is useful in reducing or increasing the size of a fruit and/or cell division in plants. This sequence represents a primer used to analyse the novel Lycopersicon gene ORFX that regulates fruit size and/or

                                                                                                                      The present invention describes an isolated polynucleotide (PN) comprising: (a) a sequence comprising at least 15 contiguous nucleotides of a sequence comprising variant sequences (A) from Table 4 given in the specification; or (b) a sequence that is complementary to (A). Also described: (1) an array of (PN)s comprising two or more of the isolated (PN)s; (2) detecting a (PN) in an individual; (3) a computer-readable storage medium, where each record has a field identifying a base occupying a (PN) site and a location of the polymorphic site; and (4) a signal carrying data for access by an application program having executed on a data processing system. The (PN) can be used for detecting loci associated with multiple sclerosis. ACF64025 to ACF64424 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 21

Also described: (1) identifying a gene(s) that is/are up-regulated by an agent; and (2) selecting a candidate compound. The solid substrate comprising the intrinsic reporters of cell signalling are useful for high content drug profiling and toxicity screening. The methods are useful for identifying set of genes that can be used in the initial stages of signal transduction pathways. The intrinsic reporters of cell signalling are also useful for identifying potential drugs that can be used to modulate conditions or diseases that are due to malfunctioning of one or more signal transduction pathways, e.g. diabetes, cancer, neuropsychiatric disorders, chronic and acute pain, or gastrointestinal disorders. ACC42160 to ACC42281 represent oligonucleotide sequences which are used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New solid substrate comprising several polymers or 50-1000 different nucleic acids coupled to the solid substrate in a different known location, useful for high content drug profiling and toxicity screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sealfon S,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Homo sapiens

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC endonuclease (RE). The ON forms, with its complement in (I), and RE crecognition site that ensures cleavage only at the selected location. CC Contact between (I) and ON, and treatment with RE, are done at a CC temperature at which (1) (I) is maintained in substantially ss form and CC (ii) RE is active. ON is (i) single stranded, and includes a sequence CC that forms, with its complement in (I), the RE site or (ii) has a double-stranded (ds) region that includes a recognition site for a type IIS RE CC that cleaves at a remote site formed by complementation of (I) and the ss CC region of ON. The method is used to construct libraries of genetic CC packages (phages) that display diverse families of (poly)peptides and CC libraries are screened to identify (A) for possible therapeutic use. The CC method is not biased to DNAs containing native sequences complementary to amplification primers and allows any sequences that may be deleterious to CC expression to be removed before cloning and display. DNAs are cut only at a single (constant) site, without the need to build an RE site into the CC primers used for reverse transcription or amplification, and any natural CC or synthetic site can be used for cleavage. The use of a partially ds ON CC can be created. Both methods allow use of 5 and 3 primers for maximum diversity. This sequence represents a sequence used in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel method for determining racing potential of a horse. The method comprises measuring: whether grandpaternal DNA is over-represented in the genome of the horse; or in the case where one of the grandmothers was selected for breeding on the basis of racing performance, whether grandmaternal DNA from the selected grandmother is over-represented in the genome of the horse which indicates that the horse has good racing potential. The method of the invention is useful for determining the racing potential of a horse or for obtaining a progeny horse with good racing potential. This polynucleotide sequence represents a PCR primer used in the detection method of over-representation of DNA from male grandparents of the invention

```

The present invention relates to the isolation of human ATP-binding cassette (ABC) transporter protein A7 (ABCA7) splice variants, and the polynucleotide sequences encoding them. The protein is applicable in the diagnosis and screening of drugs for autoimmune diseases, Sjogren's syndrome, inflammations, abnormal lipid metabolism and arteriosclerosis. It may also be used in a method for screening ABCA-SSN inhibitors. The

present sequence

represents a reverse

transcriptase (RT)-PCR

primer used

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel method for determining whether a patient has an increased risk for recurrent prepancy loss, involving determining whether the formin-2 (Fmn-2) gene of the patient has a mutation. The method of the invention is useful for determining whether a patient has a increased risk for recurrent pregnancy loss (RPL/recurrent spontaneous abortion/miscarriage). The sequence represents a PCR primer used in the invention to amplify the Fmn-2 coding sequence
                                                                                                                                                                                                                                                                                                                                                            Retroviral packaging plasmid construction PCR primer,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Determining whether patient has increased risk for recurrent pregnancy loss by determining whether formin-2 (Fmn-2) gene of patient has mutation, or by measuring Fmn-2 biological activity or Fmn-2 expression

The invention discloses a retroviral packaging plasmid for producing CC recombinant retrovirus in human cells. Retrovirus vectors have become the CC primary tool for gene delivery in human gene therapy applications. The CC incompetent retroviral helper DNA sequence, derived from a replication-incompetent retroviral genome, encoding, in trans, all virion proteins are required for packaging a replication-incompetent retroviral vector and CC incompetent retroviral vector at high titer, without production of a replication-competent helper virus. The retroviral DNA sequence lacks the CC region encoding the native enhancer and/or promoter of the viral 5' LTR (long terminal repeat) of the virus and lacks both the gsi function CC sequence responsible for packaging helper genome and the 3' LTR, but encodes a foreign enhancer and/or promoter functional in a selected CC mammalian cell, and a foreign polyadenylation site, from a xenotropic, amphotropic, ecotropic or polytropic envelope protein. The retroviral packaging plasmid is useful for a high efficiency method to transduce with high cficiency cells that are refractory to transduce with high efficiency cells that are refractory to transduction by conventional cells and nother succession of the production of high titer viral supernatants and to transduce with high efficiency cells that are refractory to transduction by conventional cells and nother successions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     genome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel retroviral packaging system useful for producing high-titers of recombinant retrovirus in human cells, comprises at least one retroviral helper DNA sequence derived from replication-incompetent retroviral
                                                       and probes used

The fusion protein can complete the viral protein is 5' of the stop codon cc which is, in turn, 5' of the targeting sequence. The fusion protein can coat protein that is native to the viral genome and is deleted or complete the viral genome and is deleted or complete the composition of cc can be a recombinant plant constructing a phenotypic or biochemical cc change in a plant host comprising constructing and introducing into a cc plant host a recombinant plant virus and then growing the plant host. The cc compositions and methods of the present invention are useful for capressing a fusion protein, a foreign protein or to silence a gene cc interest in a host. They can also be used to screen a cDNA or genomic cc library in order to correlate a nucleotide sequence with a phenotypic or biochemical change. The sequences presented in ABS67514 are the CC RC primers which were used in the construction of the monocot viral

EC1 is us to prepare adenoviral expression vectors for protein production. EC1 produce expression systems with high expression rates (associated with use of (I)) and allow simple production of genetically modified adenovirus without requiring ligation. The present sequence is that of PCR primer used to generate a rabies surface glycoprotein 1 expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Expression cassette of useful for preparing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PCR primers ABL59343-44 were used to amplify cDNA encoding an AA233368 protein. This protein is encoded by a benign prostatic hyperplasia (BPH) gene. The BPH gene is differentially expressed in BPH tissue compared to normal prostate tissue. cDNA sequences corresponding to the first and second ORFs were obtained by the oligo-pulling method. BPH nucleic acids and polypeptides may be used as diagnostic agents to detect BPH in a sample or monitor the progression of BPH in a patient. BPH proteins may serve as a target for modulating agents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel isolated polypeptide or protein encoded by a benign prostatic hyperplasia gene, useful for diagnosing a disease state such as benign prostatic hyperplasia in a subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ABS97582 standard; DNA; 21
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Munger WE,

                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a method for assessing the risk of prostate cancer in a human subject. The method involves determining the length of the contiguous CAG or CAA repeats in both AIBI (Amplified In Breast cancer 1) gene alleles or contiguous CAG, CAA or GGN repeats in the androgen receptor gene of the subject. The method is useful for assessing a subject's risk for acquiring or developing prostate cancer. The present sequence is a PCR primer used to amplify human androgen receptor (AR) gene exon 1 and is used in the molecular analysis and assessment of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Assessing the risk of acquiring or developing prostate cancer in subject, comprises determining the length of the contiguous CAG, and/or GGN repeats in the AIB1 gene and/or androgen receptor gen

biological activity of a coagulation pathway factor which involves cadministering (I) to a warm-blooded vertebrate (e.g., a mammal) such that the biological activity of the coagulation pathway factor in the warm-complete the biological activity of the coagulation pathway factor in the warm-blooded vertebrate is modulated. (I) are also useful for treating complete the cardiovascular diseases in the mammal. (II) are useful for modulating E2F contivity in a warm-blooded vertebrate. (II) are useful for modulating E2F complete the control of the activity in a warm-blooded vertebrate. (II) are potent complete the activity in a warm-blooded vertebrate. (II) are potent complete the activity in a warm-blooded vertebrate. (II) are potent control of the activity in a warm-blooded vertebrate. (II) are potent control of the activity in a warm-blooded vertebrate. (II) are useful for modulating cell proliferation in a number of conditions e.g., intimal hyperplasia following bypass graft surgery. (III) are useful for modulating angiogenesis. The RNA aptamers are also useful for diagnostic, cresearch and therapsutic context. The aptamers are useful as diagnostic context the presence or absence of target substances to which they specifically bind, and for identifying substances to which they bind, for isolating and purifying substances to which they bind, and as a separation reagent for retrieving the targets to which they bind, and so a separation reagent for retrieving the targets to which they carried the process the context of the process to the process the context of the process and an apparation of the process to the process of the process 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes RNA aptamers (I,II,III) that selectively bind: (a) a coagulation pathway factor; (b) an E2F family member; or (c) angiopoietin-1 (Ang1) or Ang2, respectively, where (I), (II), (III) have a dissociation constant for the coagulation pathway factor, an E2F famil, member, or Ang1 or Ang2 of about 20 nM or less. (I), (II) and (III) have cardiant and cytostatic activities. (I) are useful for modulating the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel RNA aptamers that selectively bind coagulation pathway factors, E family members, Angl or Ang2, useful for modulating coagulation pathway factor activity, E2F activity and Angl or Ang2 activity in a mammal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 31; Fig 17; 216pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Synthetic

                    The invention relates to a method for preventing diabetes mellitus comprising administering a platelet activating factor acetylhydrolase (PAF-AH) product to a subject at risk of developing diabetes mellitus. The method is also used to slow the progression of diabetes mellitus i patient suffering from the disease. This sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 hypersensitivity reactions, sepsis, autoimmune diseases, inflammatory arthritis, cancer, wounds, viral, bacterial or fungal infection, Chronic obstructive pulmonary disease (COPD) and enterocolitis (many other diseases and disorders are listed in the specification). The polynucleotides are also useful for chromosome identification. Antibodies against the proteins may be utilised for immunophenotyping of cell lines and biological samples. The present sequence is included in the sequence listing but is not referred to anywhere else in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           involve angiogenesis like haemangiomas, tumours, sarcomas, Crohn's disease, trachomas, and cardiovascular diseases like angina pectoris, hypertension, heart failure, myocardial infarction, ventricular hypertrophy, vascular diseases, aneurysm, embolism, thrombosis, coronary artery disease, arteriosclerosis and/or atheroscless, and arteriosclerosis, and arteriosclerosis, and arteriosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            human protein selected from the group above; and (6) genotyping (M4) an individual comprising obtaining a nucleic acid sample, determining the nucleotide present in at least one polymorphic position, and comparing a least one position with a known data set. The genes, (M1, M2, M3 and M4) and compositions are useful for detecting, diagnosing, treating, preventing various disorders such as angioedaema and diseases which involve angiogenesis like haemangiomas, tumours, sarcomas, Crohn's
                                                                                                                                                                                                                                                    Preventing diabetes mellitus comprises administering a platelet activating factor acetylhydrolase product to a subject at risk developing the disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Saccharomyces cerevisiae

                                                                                                                                                        The invention relates to a novel polynucleotide encoding a human histon acetyltransferase (HA) polypeptide. The protein of the invention has cytostatic activity. The human HA can be used to identify test compound which may act as activators or inhibitors at the enzyme's active site, raising specific antibodies which can block the enzyme and effectively reduce its activity, to treat disorders such as cancer, and to screen fouman HA activators and inhibitors. HA may also be used in diagnostic assays for detecting diseases and abnormalities or susceptibility to diseases and abnormalities related to the presence of mutations in the nucleic acid sequences which encode the enzyme. The expression vector of mutations in the nucleic acid sequences which encode the enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 21 BP; 10
                                                                               Sequence
                                                                                                                 the reagent is useful in the preparation of a medicament for modulating the activity of an HA in a disease, such as cancer. The sequence represents a PCR primer used in the invention to amplify human histone
                                                                                                                                                                                                                                                                                                                                             New isolated polynucleotide encoding a histone acetyltransferase polypeptide, useful for preventing, ameliorating and/or treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 05-FEB-2001; 2001US-0265891P.

CC encoding aminopeptidase P (FMEPE), bradykinin receptor B1 (BDRB1), cl esterase inhibitor (CLNH), kallikrein CC (ACE2) or protease inhibitor 4 (PI4), comprising at least one CC (ACE2) or protease inhibitor 4 (PI4), comprising at least one CC polymorphic position. Also included are (1) a protein that hybridises to a CC polymorphic position as provided in the detailed summary of single CC obtaining the sample from one or more individuals and determining the encoding a protein selected from the group above; (3) constructing (M1) at least one polymorphic positions in a gene CC encoding a protein selected from the group above; (3) constructing (M2) that lockypes using the genes comprising grouping at least two nucleic acids eacids (4) identifying (M3) an individual at risk of developing a disorder CC using the polymorphic data; (5) a library of nucleic acids each of which comprises one or more polymorphic positions within a gene encoding a the polymorphic data; (5) a library of nucleic acids each of which comprises one or more polymorphic positions within a gene encoding a thuman protein selected from the group above; and (6) genotyping (M4) an individual acids sender encoding a the comprising obtaining a nucleic acid sample, determining the cleast one position with a known data set. The genes, (M1), M2, M3 and M4) and compositions are useful for detecting, diagnosing, treating, and compositions are useful for detecting, diagnosing, treating, and composition with a known data set. The genes, (M1), M2, M3 and M4) and composition with a known data set. The genes, (M1), M2, M3 and M4) and composition are useful for detecting, diagnosing, treating, and involve angiogenesis like anemangiomas, tumours, sarcomas, Crohn's (M2) and compositions, had an acid sease in the acid seases which compositions, which compositions, the proteins, and compositions, the proteins, and compositions, the proteins, and the proteins, and composition, coronary compositions, the proteins and compositions, the proteins and compositions, the pro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               04-DEC-2000;

PA (T
encoding aminopeptidase P (XPNEP2), bradykinin receptor B1 (BDKRB1), C1 catchykinin receptor B1 (TACR1), C1 esterase inhibitor (C1NH), kallikrein CC 1 (KLKI), bradykinin receptor B2 (BDKRB2), angiotensin converting enzyme CC (ACE2) or protease inhibitor 4 (P14), comprising at least one CC polymorphic position. Also included are (1) a probe that hybridises to a CC polymorphic position as provided in the detailed summary of single CC nucleotide polymorphisms comprising additional 5 and 3 flanking genomic CC sequence; (2) analysing (M1) at least one nucleic acid sample comprising CC obtaining the sample from one or more individuals and determining the constitution of an accidence of the group above; (3) constructing (M2) an individual at risk of developing a disorder CC using the polymorphic data; (5) a library of nucleic acide, each of which comprises one or more polymorphic positions enhabitor using the polymorphic data; (5) a library of nucleic acide, each of which comprises one or more polymorphic positions within a gene encoding a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         aminopeptidase P; XPNEP2; bradykinin receptor B1; ds; BDKRB1; tachykinin receptor B1; TACR1; C1 esterase inhibitor; C1NH; k KLK1; bradykinin receptor B2; BDKRB2; gene therapy; angiotensin converting enzyme 2; ACB2; protease inhibitor 4; polymorphism; haemangioma; tumour; sarcoma; Crohn's disease; cardiovascular disease;

```
CC 1 (KLH1), bradykinin receptor B2 (BDKBB2), angiotensin converting enzyme CC (ACE2) or protease inhibitor 4 (P14), comprising at least one CC polymorphic position. Also included are (1) a probe that hybridises to a CC polymorphic position as provided in the detailed summary of single CC nucleotide polymorphisms comprising additional 5 and 3 flanking genomic CC sequence; (2) analysing (M1) at least one nucleic acid sample comprising containing the sample from one or more polymorphic positions in a gene CC encoding a protein selected from the group above; (3) constructing (M2) applotypes using the genes comprising grouping at least two nucleic acids (4) identifying (M3) an individual at risk of developing a disorder CC using the polymorphic data; (5) a library of nucleic acids, each of which comprises one or more polymorphic positions within a gene encoding a comprising obtaining a nucleic acid sample, determining the number of protein selected from the group above; and (6) genotyping (M4) an comprises one or more polymorphic positions within a gene encoding a comprising obtaining a nucleic acid sample, determining the nucleid and composition with a known data set. The genes, (M1, M2, M3 and M4) and composition with a known data set. The genes, (M1, M2, M3 and M4) consposition with a sand catecting, diagnosing, treating, consposition with a known data set. The genes, (M1, M2, M3 and M4) and consposition with a known data set. The genes, (M2, M3 and M4) consposition, heart failure, myocardial infarction, ventricular converting and consposition, heart failure, myocardial infarction, ventricular consposits, and categors and/or atherosclerosis, and
                                                                                              artery disease, arteriosclerosis and/or atherosclerosis, and hypersensitivity reactions, sepsis, autoimmune diseases, inflammatory arthritis, cancer, wounds, viral, bacterial or fungal infection, Chronic obstructive pulmonary disease (COPD) and enterocolltis (many other diseases and disorders are listed in the specification). The polynucleotides are also useful for chromosome identification. Antibodies against the proteins may be utilised for immunophenotyping of cell lines and biological samples. The present sequence is included in the sequence listing but is not referred to anywhere else in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           encoding aminopeptidase P (XPNE tachykinin receptor B1 (TACR1),

```
CC nucleic acid sequence at one or more polymorphic positions in a gene ce encoding a protein selected from the group above; (3) constructing (M2) cc haplotypes using the genes comprising grouping at least two nucleic acids (4) identifying (M3) an individual at risk of developing a disorder cusing the polymorphic data; (5) a library of nucleic acids, each of which comprises one or more polymorphic positions within a gene encoding a comman protein selected from the group above; and (6) genotyping (M4) an individual comprising obtaining a nucleic acid sample, determining the nucleitide present in at least one polymorphic position, and comparing at comprises one position with a known data set. The genes, (M1, M2, M3 and M4) cand compositions are useful for detecting, diagnosing, treating, cand compositions are useful for detecting, diagnosing, treating, corporate disease, trachomas, and cardiovascular diseases like angina pectoris, hypertension, heart failure, myocardial infarction, ventricular chypertension, theart failure, myocardial infarction, ventricular chypertensitivity reactions, sepsis, antervacelerosis and/or atherosclerosis, and mypersensitivity reactions, sepsis, autorimmune diseases, inflammatory cardinal the restrictive pulmonary disease (COPD) and enterocolitis (many other colorities and diseases are also useful for chromosome identification. Antibodies cardinate the nortering may be utilized for immune benotoring of call lines.

CC encoding aminopeptidase P (XPNEP2), bradykinin receptor B1 (BDKBE1), C1 esterase inhibitor (CLNH), kallikrein C1 (KLK1), bradykinin receptor B2 (BDKRB2), angiotensin converting enzyme C2 (ACE2) or protease inhibitor 4 (PI4), comprising at least one C2 polymorphic position. Also included are (1) a probe that hybridises to a C3 polymorphic position as provided in the detailed summary of single C3 (ACE2) or protease this comprising additional 5 and 3 flanking genomic C4 careful polymorphisms comprising additional 5 and 3 flanking genomic C5 eaquence; (2) analysing (M1) at least one nucleic acid sample comprising C6 obtaining the sample from one or more polymorphic positions in a gene C6 encoding a protein selected from the group above; (3) constructing (M2) the protein selected from the group above; (3) constructing (M2) captives using the genes comprising grouping at least two nucleic acids (4) identifying (M3) an individual at risk of developing a disorder C6 using the polymorphic data; (5) a library of nucleic acids, each of which C6 comprises one or more polymorphic positions within a gene encoding a midividual comprising obtaining a nucleic acid sample, determining the concleotide present in at least one polymorphic position, and comparing at least one position with a known data set. The genes, (M1, M2, M3 and M4) cand compositions are useful for detecting, diagnosing, treating,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The specification describes a method of screening for compounds, which are useful for prevention and/or treatment of atherosclerosis in humans. The method comprises the comparative detection of T cells carrying the invariant chain Valpha14-Jalpha281 in atherosclerotic lesions (or their mimics), in absence and presence of test compounds. The compounds modulate the activity (especially cytokine release) and migration of T cells. The migration of T cells into lesions is a good marker for infiltration of other immune system cells. The compounds are used for treatment and/or prevention of arteriosclerosis, particularly in combination with hypocholesterolemic agents. The present sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The specification describes a chimeric protein which has, in N- to C-
CC terminal direction, a non-major histocompatability complex (MHC)
CC restricted extracellular binding domain, transmembrane domain, and
CC ytoplasmic signal-transducing domain of protein that activates
CC intracellular messenger system. The chimeric protein is expressed as
CC membrane bound protein in the host cell which initiates signalling, when
CC the extracellular domain binds a ligand. The transmembrane domain is
CC obtained from a protein selected from CD4, CD8, immunoglobulin, CD3 zeta
CC chain, CD3 gamma chain, CD3 delta chain, and the CD3 epsilon chain. The
CC cytoplasmic signal-transducing domain is obtained from CD3 zeta. The
CC extracellular domain and the cytoplasmic domain are not naturally joined
CC together (or vice versa), and when the extracellular domain binds the
CC ligand, the chimeric DNA is expressed as a membrane bound protein in a
CC host cell under conditions suitable for expression, which initiates
CC signalling in the host cell. The chimeric protein induces cytotoxicity.
CC It is useful for signal transduction, and for the investigation of
CC particular pathways controlled by signal transduction. The chimeric
CC protein is also useful for gene therapy, The present sequence represents
CC aincle chain antibody-zeta chimeric receptors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                S
                                                                                                                                                                                        CC This invention comprises a method of purifying double-stranded DNA from a CC solution containing the double-stranded DNA mixed with other components, CC comprising passing the solution through a support comprising a covalently CC coupled oligonucleotide capable of forming a triple helix with the double cranded DNA by hybridisation with a specific sequence present in the CC double-stranded DNA. The method is useful for purifying double-stranded CC DNA contained in a solution and mixed with other components. The new CC method is a ssimple, rapid and effective method for DNA purification, and CC makes it possible to obtain especially high purities with high yields. CC The method enables DNA to be purified from complex mixtures comprising CC other nucleic acids, proteins, endotoxins, nucleases and the like. The CC supports may be readily recycled, and the DNAs obtained display improved properties to pharmaceutical safety. Further, the method entails only one step contrary to prior art. The present sequence represents the (CTT)? CC oligonucleotide sequence which is capable of forming a triple helix with CC can be used in the DNA purification method of the invention

When the single chain antibody domain binds to the viral or tumour antigen on the cell, the modified T cells kill cells expressing the antigens. The modified T cells are used for treating malignant diseases and viral infection especially by, human immunodeficiency virus (HIV), cytomegalovirus, hepatitis C, hepatitis B, and mycobacterium avium. The present sequence is a PCR primer used to amplify a nucleic acid encoding antibody mAb 98.6 light chain variable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 14-DEC-1990;
